CONCEPT NOTE

PROJECT TITLE:

- ***AI/ML powered project approaches to resolve land use conflicts***

COURSE:

- ***BTECH CSE -SECTION-1CSE26***

SUBJECT:

- ***ARTIFICIAL INTELLEGENCE AND MACHINE LEARNING***

NAME:

- ***ROHIT GUPTA***

ROLL NUMBER:

- ***25SCS1003003270***

COLLEGE: ***IILM UNIVERSITY***

SUBMITTED TO: ***Dr.SAURABH SHANU***

PROBLEM STATEMENT:

- ***Land use conflicts refers to the conflicts between different people such as Farmers , environmentalist, urban development planners, etc for the same piece of land. Farmers want more Farmland, urban development planner wants urbanization and environmentalist want to protect forest and land for protecting ecosystem. These conflicts of interests leads to disputes, environmental degradation for example= Uttrakhand's Forest land use for road construction & factory Setup which leads to dispute between environmentalist & Urban also leads to problems like deforestation, soil erosion, Climate Change. Currently, the land planning is done by government Surveys & Studies. This process takes alot of time & are not precise and accurate in many cases.***

PROPOSED SOLUTION

- ***A smarter and faster with good accuracy is required to reduce these conflicts and find out where conflicts are most likely to happen and which will be the most suitable land for different groups like agriculture, urbanization and forest for sustainable future.This project made with the use of artificial intelligence and machine learning to analyze land use data by using satellite maps and find potential disputes which can happen by using algorithm like artificial neural network and classify land into agricultural land,land for urbanization and forest land.we can also use prediction models to see areas which may change in future like where will be urbanization most likely to happen,where agricultural land will be more beneficial,etc.***

EXPECTED OUTPUTS

- ***This model will classifies land into Different categories such as urbanization , agriculture, Forest.***
- ***Maps will highlight whers conficts are most likely to occur.***
- ***Prediction of Future changes in land use in advance.***
- ***It will help in planning sustainable land use and will reduce dispute in less time and more accuracy.***
